

Reflection Report Instructions

The reflection report is an **individual submission** of **one page max**. It must provide a concise and evidence-based reflection on both your own engineering contribution and one peer's implementation.

Across each team, every member must be evaluated once. Select a **different peer** from your teammates so that no team member is evaluated more than once.

Write clearly, organise your reflection logically, and use professional engineering language. Support your observations and recommendations with relevant technical reasoning and, where appropriate, evidence such as results, tests, comparisons against requirements, or design constraints. Please refer to the [rubric](#).

Required sections

1. Your engineering contribution ~ ¼ page

Explain your role and contribution to the project. For example, you can address:

- The components, tasks, analyses, or designs you completed
- Key engineering decisions you owned and why you made them
- How your work progressed, including methods or design approaches selected
- Significant challenges, alternatives considered, and how you addressed them
- The outcomes of your work and its relationship to the overall team outcome
- How you verified or evaluated your contribution, using evidence where available

2. Peer's engineering contribution ~ ⅓ page

Select one team member and critically reflect on their implementation. For example, you can address:

- Their role and the component, task, analysis, or design they implemented
- Your understanding of their key engineering decisions and the reasons behind them
- How their contribution supported, constrained, or interacted with the wider team project

3. Recommended improvement to Peer's contribution ~ ⅔ page

Propose one realistic improvement to your peer's implementation in the context of the broader project. For example, you could address:

- A specific limitation, risk, or opportunity in the present deliverable that can be addressed with an extension
- Describe the proposed technical change clearly
- Justify it with sound engineering reasoning

- Indicate the benefit to a customer for such an improvement (why should they invest in this?)
- Explain the expected impact on performance, reliability, accuracy, usability, cost, safety, maintainability, or another relevant project criterion
- Where relevant, note practical constraints or trade-offs associated with the recommendation

Your report should go beyond simply describing what each person did: it should explain why engineering decisions mattered, what outcomes they produced, and how the work could be improved.
